

Advanced MT5 Grid Hedging EA

User Guide & Implementation Manual

Note: This Expert Advisor is designed specifically for **MT5 Hedging Accounts**. Ensure your trading account supports hedging before use.

1. Strategy Overview

The Advanced MT5 Grid Hedging EA uses a sophisticated algorithm that combines dynamic grid expansion with bi-directional hedging. Key features include:

- **Dynamic Grid:** Adds positions at specified intervals (pips/points).
- **Hedging logic:** Automatically opens opposite trades if the market reverses.
- **Progressive Lot Scaling:** Increases lot size incrementally only after a failed cycle to recover losses.
- **Candlestick Filtering:** (Optional) Only enters initial trades on high-probability price action patterns.

2. Installation Guide

- Step 1:** Locate your MT5 Data Folder (File > Open Data Folder).
- Step 2:** Copy GridHedge_EA.mq5 and CandlePatterns.mqh into MQL5/Experts/.
- Step 3:** Refresh the Navigator in MT5 or restart MT5.
- Step 4:** Open a chart of your preferred instrument (Forex, Gold, Crypto, etc.).
- Step 5:** Drag the EA onto the chart and ensure "Allow Algo Trading" is enabled in both the EA settings and the MT5 top bar.

3. Key Input Parameters

Parameter	Description
Starting Lot Size	Initial volume for the first trade of a cycle.

Grid Offset (Pips)	Distance between grid levels/trades.
Max Grid Trades	Max number of positions allowed per side (Buy/Sell).
Take Profit (\$)	Total floating profit in account currency to close all trades.
Max Loss (\$)	Safety stop for the entire cycle in account currency.
Lot Increment	Additional lot size added after a failed cycle.

4. Strategy Logic (Example)

If you start a BUY cycle at 2000.00 with 100 points grid:

1. Market goes to 2001.00: Second BUY opens.
2. Market reverses to 1999.00: First SELL (Hedge) opens.
3. If total profit from all buys and sells reaches your target (e.g., \$10): **All positions close immediately.**

5. Risk Disclaimer

Warning: Trading involves significant risk. Grid and Martingale-based strategies can lead to large drawdowns. Always test on a Demo account before using live funds. The developer is not responsible for any financial losses.
